# 1 Graphs

**Definition 1.** A graph  $G$  consists of two finite sets: a nonempty set  $V(G)$  of vertices and a set  $E(G)$  of edges, where each edge is associated with a set consisting of either one or two vertices called its endpoints. Formally, a graph is defined as an ordered pair  $G = (V, E)$ , where  $V$  is the set of vertices and  $E$  is the set of edges

$$G = (V, E)$$

$$V = \{v_1, v_2, v_3, \dots, v_n\}$$

$$E = \{e_1, e_2, e_3, \dots, e_m\}.$$

$$V = \{v_1, v_2, v_3, v_4\}$$

$$E = \{e_1, e_2, e_3, e_4, e_5\}.$$

We can also represent the edges by only stating the vertices which connect the edges

Edges	Endpoints
$e_1$	$\{v_1, v_2\}$
$e_2$	$\{v_1, v_3\}$
$e_3$	$\{v_2, v_3\}$
$e_4$	$\{v_3, v_4\}$
$e_5$	$\{v_4\}$

## 2 Subgraphs

**Definition 2.** Graph  $H$  is said to be a subgraph of a graph  $G$  iff every vertex in  $H$  is also a vertex in  $G$ , every edge in  $H$  is also an edge in  $G$ , and every edge in  $H$  has the same endpoints as it has in  $G$ .
