1 Calc II

1.1 Chapter 1 Key Equations

- **Mean Value Theorem For Integrals**: If $f(x)$ is continuous over an interval [a,b], then there is at least one point $c \in [a, b]$ such that

$$f(c) = \frac{1}{b-a} \int f(x)\ dx.$$

- **Integrals resulting in inverse trig functions**

  1.
  $$\int \frac{dx}{\sqrt{a^2 - x^2}} = \sin^{-1} \frac{x}{|a|} + C.$$

  2.
  $$\int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \frac{x}{a} + C.$$

  3.
  $$\int \frac{dx}{x\sqrt{x^2 - a^2}} = \frac{1}{|a|} \sec^{-1} \frac{|x|}{a} + C.$$

1.2 Chapter 2 Key Terms

- **Arc length:** The arc length of a curve can be thought of as the distance a person would travel along the path of the curve.
- **Catenary:** A curve in the shape of the function $y = a\cosh(x/a)$ is a catenary; a cable of uniform density suspended between two supports assumes the shape of a catenary.
- **Center of mass:** The point at which the total mass of the system could be concentrated without changing the moment.
- **Centroid:** The centroid of a region is the geometric center of the region; laminas are often represented by regions in the plane; if the lamina has a constant density, the center of mass of the lamina depends only on the shape of the corresponding planar region; in this case, the center of mass of the lamina corresponds to the centroid of the representative region.
- **Cross-section:** The intersection of a plane and a solid object.
- **Density function:** A density function describes how mass is distributed throughout an object; it can be a linear density, expressed in terms of mass per unit length; an area density, expressed in terms of mass per unit area; or a volume density, expressed in terms of mass per unit volume; weight-density is also used to describe weight (rather than mass) per unit volume.
- **Disk method:** A special case of the slicing method used with solids of revolution when the slices are disks.
- **Doubling time:** If a quantity grows exponentially, the doubling time is the amount of time it takes the quantity to double, and is given by $\frac{\ln 2}{k}$.
- **Exponential decay:** Systems that exhibit exponential decay follow a model of the form $y = y_0 e^{-kt}$.
- **Exponential growth:** Systems that exhibit exponential growth follow a model of the form $y = y_0 e^{kt}$.
- **Frustum:** A portion of a cone; a frustum is constructed by cutting the cone with a plane parallel to the base.
- **Half-life:** If a quantity decays exponentially, the half-life is the amount of time it takes the quantity to be reduced by half. It is given by $\frac{\ln 2}{k}$.
- **Hooke's Law:** This law states that the force required to compress (or elongate) a spring is proportional to the distance the spring has been compressed (or stretched) from equilibrium; in other words, $F = kx$, where k is a constant.
- **Hydrostatic pressure:** The pressure exerted by water on a submerged object.
- **Lamina:** A thin sheet of material; laminas are thin enough that, for mathematical purposes, they can be treated as if they are two-dimensional.
- **Method of cylindrical shells:** A method of calculating the volume of a solid of revolution by dividing the solid into nested cylindrical shells; this method is different from the methods of disks or washers in that we integrate with respect to the opposite variable.
- **Moment:** If n masses are arranged on a number line, the moment of the system with respect to the origin is given by $M = \sum_{i=1}^{n} m_i x_i$; if, instead, we consider a region in the plane, bounded above by a function $f(x)$ over an interval $[a, b]$, then the moments of the region with respect to the x- and y-axes are given by $M_x = \rho \int_a^b \frac{[f(x)]^2}{2} dx$ and $M_y = \rho \int_a^b x f(x) dx$, respectively.
- **Slicing method:** A method of calculating the volume of a solid that involves cutting the solid into pieces, estimating the volume of each piece, then adding these estimates to arrive at an estimate of the total volume; as the number of slices goes to infinity, this estimate becomes an integral that gives the exact value of the volume.
- **Solid of revolution:** A solid generated by revolving a region in a plane around a line in that plane.

- **Surface area:** The surface area of a solid is the total area of the outer layer of the object; for objects such as cubes or bricks, the surface area of the object is the sum of the areas of all of its faces.
- **Symmetry principle:** The symmetry principle states that if a region R is symmetric about a line l, then the centroid of R lies on l.
- **Theorem of Pappus for volume:** This theorem states that the volume of a solid of revolution formed by revolving a region around an external axis is equal to the area of the region multiplied by the distance traveled by the centroid of the region.
- **Washer method:** A special case of the slicing method used with solids of revolution when the slices are washers.
- **Work:** The amount of energy it takes to move an object; in physics, when a force is constant, work is expressed as the product of force and distance.

1.3 Chapter 2 Key Equations

- **Area between two curves, integrating on the x-axis**

$$A = \int_a^b [f(x) - g(x)]\, dx \tag{1}$$

- **Area between two curves, integrating on the y-axis**

$$A = \int_c^d [u(y) - v(y)]\, dy \tag{2}$$

- **Disk Method along the x-axis**

$$V = \int_a^b \pi [f(x)]^2\, dx \tag{3}$$

- **Disk Method along the y-axis**

$$V = \int_c^d \pi [g(y)]^2\, dy \tag{4}$$

- **Washer Method**

$$V = \int_a^b \pi [(f(x))^2 - (g(x))^2]\, dx \tag{5}$$

- **Method of Cylindrical Shells**

$$V = \int_a^b 2\pi x f(x)\, dx \tag{6}$$

- **Arc Length of a Function of x**

$$\text{Arc Length} = \int_a^b \sqrt{1 + [f'(x)]^2}\, dx \tag{7}$$

- **Arc Length of a Function of y**

$$\text{Arc Length} = \int_c^d \sqrt{1 + [g'(y)]^2}\, dy \tag{8}$$

- **Surface Area of a Function of x**

$$\text{Surface Area} = \int_a^b 2\pi f(x) \sqrt{1 + [f'(x)]^2}\, dx \tag{9}$$

- **Mass of a one-dimensional object**

$$m = \int_a^b \rho(x)\, dx \tag{10}$$

- **Mass of a circular object**

$$m = \int_0^r 2\pi x \rho(x)\, dx \tag{11}$$

- **Work done on an object**

$$W = \int_a^b F(x)\,dx \tag{12}$$

- **Hydrostatic force on a plate**

$$F = \int_a^b \rho w(x) s(x)\,dx \tag{13}$$

- **Mass of a lamina**

$$m = \rho \int_a^b f(x)\,dx \tag{14}$$

- **Moments of a lamina**

$$M_x = \rho \int_a^b \frac{[f(x)]^2}{2}\,dx, \quad M_y = \rho \int_a^b x f(x)\,dx \tag{15}$$

- **Center of mass of a lamina**

$$\bar{x} = \frac{M_y}{m}, \quad \text{and} \quad \bar{y} = \frac{M_x}{m} \tag{16}$$

- **Natural logarithm function**

$$\ln x = \int_1^x \frac{1}{t}\,dt \;\; Z \tag{17}$$

- **Exponential function**

$$y = e^x, \quad \ln y = \ln(e^x) = x \;\; Z \tag{18}$$
