1 Calc II

1.1 Chapter 1 Key Equations

• Mean Value Theorem For Integrals: If f(x) is continuous over an interval [a,b], then there is at least one point $c \in [a,b]$ such that

$$f(c) = \frac{1}{b-a} \int f(x) \ dx.$$

• Integrals resulting in inverse trig functions

1.

$$\int \frac{dx}{\sqrt{a^2 - x^2}} = \sin^{-1} \frac{x}{|a|} + C.$$

2.

$$\int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \frac{x}{a} + C.$$

3.

$$\int \frac{dx}{x\sqrt{x^2 - a^2}} = \frac{1}{|a|} \sec^{-1} \frac{|x|}{a} + C.$$

1.2 Chapter 2 Key Terms / Ideas

- Finding limits of integration for region between two functions: Usually, we want our limits of integration to be the points where the functions intersect
- A "complex region" between curves usually refers to an area that is not easily described by a single, continuous function over the interval of interest.
- Arc length: The arc length of a curve can be thought of as the distance a person would travel along the path of the curve.
- Catenary: A curve in the shape of the function $y = a \cosh(x/a)$ is a catenary; a cable of uniform density suspended between two supports assumes the shape of a catenary.
- Center of mass: The point at which the total mass of the system could be concentrated without changing the moment.
- Centroid: The centroid of a region is the geometric center of the region; laminas are often represented by regions in the plane; if the lamina has a constant density, the center of mass of the lamina depends only on the shape of the corresponding planar region; in this case, the center of mass of the lamina corresponds to the centroid of the representative region.
- Cross-section: The intersection of a plane and a solid object.
- **Density function:** A density function describes how mass is distributed throughout an object; it can be a linear density, expressed in terms of mass per unit length; an area density, expressed in terms of mass per unit area; or a volume density, expressed in terms of mass per unit volume; weight-density is also used to describe weight (rather than mass) per unit volume.
- Disk method: A special case of the slicing method used with solids of revolution when the slices are disks.
- **Doubling time:** If a quantity grows exponentially, the doubling time is the amount of time it takes the quantity to double, and is given by $\frac{\ln 2}{k}$.
- Exponential decay: Systems that exhibit exponential decay follow a model of the form $y = y_0 e^{-kt}$.
- Exponential growth: Systems that exhibit exponential growth follow a model of the form $y = y_0 e^{kt}$.
- Frustum: A portion of a cone; a frustum is constructed by cutting the cone with a plane parallel to the base.
- Half-life: If a quantity decays exponentially, the half-life is the amount of time it takes the quantity to be reduced by half. It is given by $\frac{\ln 2}{k}$.
- Hooke's Law: This law states that the force required to compress (or elongate) a spring is proportional to the distance the spring has been compressed (or stretched) from equilibrium; in other words, F = kx, where k is a constant.
- Hydrostatic pressure: The pressure exerted by water on a submerged object.
- Lamina: A thin sheet of material; laminas are thin enough that, for mathematical purposes, they can be treated as if they are two-dimensional.
- Method of cylindrical shells: A method of calculating the volume of a solid of revolution by dividing the solid into nested cylindrical shells; this method is different from the methods of disks or washers in that we integrate with respect to the opposite variable.
- Moment: If n masses are arranged on a number line, the moment of the system with respect to the origin is given by $M = \sum_{i=1}^{n} m_i x_i$; if, instead, we consider a region in the plane, bounded above by a function f(x) over an interval [a,b], then the moments of the region with respect to the x- and y-axes are given by $M_x = \rho \int_a^b \frac{[f(x)]^2}{2} dx$ and $M_y = \rho \int_a^b x f(x) dx$, respectively.

- Slicing method: A method of calculating the volume of a solid that involves cutting the solid into pieces, estimating the volume of each piece, then adding these estimates to arrive at an estimate of the total volume; as the number of slices goes to infinity, this estimate becomes an integral that gives the exact value of the volume.
- Solid of revolution: A solid generated by revolving a region in a plane around a line in that plane.
- **Surface area:** The surface area of a solid is the total area of the outer layer of the object; for objects such as cubes or bricks, the surface area of the object is the sum of the areas of all of its faces.
- Symmetry principle: The symmetry principle states that if a region R is symmetric about a line l, then the centroid of R lies on l.
- Theorem of Pappus for volume: This theorem states that the volume of a solid of revolution formed by revolving a region around an external axis is equal to the area of the region multiplied by the distance traveled by the centroid of the region.
- Washer method: A special case of the slicing method used with solids of revolution when the slices are washers.
- Work: The amount of energy it takes to move an object; in physics, when a force is constant, work is expressed as the product of force and distance.

1.3 Chapter 2 Key Equations

• Area between two curves, integrating on the x-axis

$$A = \int_{a}^{b} [f(x) - g(x)] dx \tag{1}$$

Where $f(x) \ge g(x)$

$$A = \int_a^b \left[g(x) - f(x) \right] dx.$$

for $g(x) \ge f(x)$

• Areas of compound regions

$$\int_a^b |f(x) - g(x)| \ dx.$$

• Area of complex regions

$$\int_a^b f(x) \ dx + \int_b^c g(x) \ dx.$$

• Area between two curves, integrating on the y-axis

$$A = \int_{c}^{d} \left[u(y) - v(y) \right] dy \tag{2}$$

• Disk Method along the x-axis

$$V = \int_a^b \pi [f(x)]^2 dx \tag{3}$$

• Disk Method along the y-axis

$$V = \int_{a}^{d} \pi [g(y)]^2 dy \tag{4}$$

• Washer Method

$$V = \int_{a}^{b} \pi [(f(x))^{2} - (g(x))^{2}] dx$$
 (5)

• Method of Cylindrical Shells

$$V = \int_{a}^{b} 2\pi x f(x) dx \tag{6}$$

· Arc Length of a Function of x

$$Arc Length = \int_{a}^{b} \sqrt{1 + [f'(x)]^2} dx \tag{7}$$

• Arc Length of a Function of y

$$Arc Length = \int_{c}^{d} \sqrt{1 + [g'(y)]^2} \, dy$$
(8)

• Surface Area of a Function of x

Surface Area =
$$\int_{a}^{b} 2\pi f(x) \sqrt{1 + [f'(x)]^2} dx$$
 (9)

· Mass of a one-dimensional object

$$m = \int_{a}^{b} \rho(x) dx \tag{10}$$

• Mass of a circular object

$$m = \int_0^r 2\pi x \rho(x) \, dx \tag{11}$$

• Work done on an object

$$W = \int_{a}^{b} F(x) dx \tag{12}$$

• Hydrostatic force on a plate

$$F = \int_{a}^{b} \rho w(x)s(x) dx \tag{13}$$

• Mass of a lamina

$$m = \rho \int_{a}^{b} f(x) dx \tag{14}$$

• Moments of a lamina

$$M_x = \rho \int_a^b \frac{[f(x)]^2}{2} dx, \quad M_y = \rho \int_a^b x f(x) dx$$
 (15)

· Center of mass of a lamina

$$\bar{x} = \frac{M_y}{m}$$
, and $\bar{y} = \frac{M_x}{m}$ (16)

• Natural logarithm function

$$\ln x = \int_1^x \frac{1}{t} dt \ Z \tag{17}$$

• Exponential function

$$y = e^x, \quad \ln y = \ln(e^x) = x \ Z \tag{18}$$
